AcceptEmail
on safety and usability

AcceptEmail
Paying bills the easy way.

Safety and usability are key

AcceptEmail adheres to a strict security policy and uses the most advanced technology in the world. This allows businesses to safely send digital invoices and customers to quickly pay. All by email! Smartpix technology in the email's payment bar enables both parties to check the status of the payment. The dynamic bar prevents people from making double payments. For added security, the bar is digitally signed and receives information through a separate, high security connection.

Unique and one-off

Every AcceptEmail is unique, and generated only once. Every AcceptEmail contains a secure payment bar that cannot be altered by customers. As soon as people click on the payment bar in the email, they land on a SSL secured and unique Internet transaction page. The URL of this transaction page always starts with https://transaction. acceptemail.com/

Encryption

To shield the data exchange from unwanted viewers during transactions, AcceptEmail uses encryption, or encoding the data with a Secure Socket Layer or SSL connection. The lock icon appearing in the status bar of your browser confirms to the viewer that it is a secure website. When you click on this icon, you'll see more information about security providers, type and levels. To guarantee security, AcceptEmail transaction connections are 256-bits encrypted, with a 2048-bits encrypted certificate, using an Extended Validation certificate – so you are assured that our corporate data have been checked by the Certificate Authority.

Personal account

When you begin receiving AcceptEmails, you can create a secure personal account, free of charge – for access to all AcceptEmails received. When in doubt about the authenticity of an incoming email, you can always confirm it using their secure personal account. AcceptEmails in the account can be re-sent to the registered email account, so you never need to worry about accidentally deleting anything from your inbox. And you always have access to proof of payment.

Confidential information

To use an AcceptMail, you don't need to enter any confidential information or account numbers. Just choose your bank, and complete the payment using their bank's secure online environment. For greater protection, AcceptEmail has no access to this secure environment.

System security

AcceptEmail offers professional services based on an extensive SLA (Service Level Agreement). Our platform is hosted by an ISAE3402 audited / ISO 27001 certified hosting partner, specialized in mission critical transaction handling. This hosting partner accommodates systems that handle a large percentage of all transactions in the Netherlands. The system operates behind very strict double firewalls, is continually monitored, and was set up to function completely redundantly.
